## Remark

Through the all of presentation we will suppose that all fields have 0 characteristic.

## Definition

Field  $F$  is differential if it's equipped with the unary function  $'$  such that:

- ▶  $(a + b)' = a' + b'$
- ▶  $(ab)' = a'b + ab'$

## Remark

Through the all of presentation we will suppose that all fields have 0 characteristic.

## Definition

Field  $F$  is differential if it's equipped with the unary function  $'$  such that:

- ▶  $(a + b)' = a' + b'$
- ▶  $(ab)' = a'b + ab'$

## Definition

Subfield  $K \subseteq F$ ,  $K = \{a \in F \mid a' = 0\}$  is called subfield of constants.

## Remark

Through the all of presentation we will suppose that all fields have 0 characteristic.

## Definition

Field  $F$  is differential if it's equipped with the unary function  $'$  such that:

- ▶  $(a + b)' = a' + b'$
- ▶  $(ab)' = a'b + ab'$

## Definition

Subfield  $K \subseteq F$ ,  $K = \{a \in F \mid a' = 0\}$  is called subfield of constants.

## Definition

Differential extension of the differential field  $F$  is field  $E$  such that  $E \supseteq F$  and there is the same differentiation  $'$  on  $E$ .

## Remark

Through the all of presentation we will suppose that all fields have 0 characteristic.

## Definition

Field  $F$  is differential if it's equipped with the unary function  $'$  such that:

- ▶  $(a + b)' = a' + b'$
- ▶  $(ab)' = a'b + ab'$

## Definition

Subfield  $K \subseteq F$ ,  $K = \{a \in F \mid a' = 0\}$  is called subfield of constants.

## Definition

Differential extension of the differential field  $F$  is field  $E$  such that  $E \supseteq F$  and there is the same differentiation  $'$  on  $E$ .

## Definition

Let  $F$  be the differential field. Then

- ▶  $b$  is called the logarithm of  $a$  if  $b' = \frac{a'}{a}$
- ▶  $b$  is called the exponent of  $a$  if  $a' = \frac{b'}{b}$

# What are functions

## Definition

The extension  $E$  of  $F$  is called elementary if it can be presented as  $E = F(t_1, \dots, t_n)$  and for all  $i$   $t_i$  is logarithm or exponent or algebraic over  $F(t_1, \dots, t_{i-1})$ .

The main corollary

Some special cases

On elliptic integrals

## Definition

The extension  $E$  of  $F$  is called elementary if it can be presented as  $E = F(t_1, \dots, t_n)$  and for all  $i$   $t_i$  is logarithm or exponent or algebraic over  $F(t_1, \dots, t_{i-1})$ .

## Remark

Common sense says us that some function  $f : \mathbb{C} \rightarrow \mathbb{C}$  is elementary iff it can be constructed via finite number of radicals, sines, cosines, exponents, logarithms and hyperbolic functions. One can see that it's consistent with our approach. Furthermore our definition on elementarity is more general.

## Theorem (Liouville, 1833-1841)

Let  $F$  be a differential field, and  $K$  is its subfield of constants. If for  $\alpha \in F$  equation  $x' = \alpha$  has the solution in some elementary extension of  $F$ , such that its subfield of constants is still  $K$ , then

$$\alpha = \sum_{i=1}^m c_i \frac{u_i'}{u_i} + v'$$

for some  $c_1, \dots, c_m \in K$ ,  $u_1, \dots, u_m, v \in F$ .

## Lemma

Let  $F$  be a differential field,  $t$  is transcendental over  $F$ , and  $t$  is a logarithm or an exponent of some element from  $F$ . And let  $f \in F[x]$  be a polynomial,  $\deg f = k \geq 1$

- ▶ If  $t$  is a logarithm then the degree of  $(f(t))'$  is  $k$  if the leading coefficient of  $f$  is not a constant, and it has degree  $k - 1$  if the leading coefficient is a constant.
- ▶ If  $t$  is an exponent then the degree of  $(f(t))'$  is  $k$  and it's multiple of  $k$  if and only if  $f$  is a monomial.

## Lemma

Let  $F$  be a differential field,  $t$  is transcendental over  $F$ , and  $t$  is a logarithm or an exponent of some element from  $F$ . And let  $f \in F[x]$  be a polynomial,  $\deg f = k \geq 1$

- ▶ If  $t$  is a logarithm then the degree of  $(f(t))'$  is  $k$  if the leading coefficient of  $f$  is not a constant, and it has degree  $k - 1$  if the leading coefficient is a constant.
- ▶ If  $t$  is an exponent then the degree of  $(f(t))'$  is  $k$  and it's multiple of  $k$  if and only if  $f$  is a monomial.

## Proof.

It's a quite simple technical exercise. □

# Liouville's Theorem (proof)

Let  $x$  be the solution of differential equation mentioned above. And  $x \in F(t_1, \dots, t_n)$ .

We will use induction on  $n$  (we don't fix the field  $F$ ).

For short we denote  $t = t_1$ .

$t$  is algebraic

Corollaries

The main corollary

Some special cases

On elliptic integrals

Let  $x$  be the solution of differential equation mentioned above. And  $x \in F(t_1, \dots, t_n)$ .

We will use induction on  $n$  (we don't fix the field  $F$ ).

For short we denote  $t = t_1$ .

Using the inductive assumption, we get

$$\alpha = \sum_{i=1}^m c_i \frac{u_i'}{u_i} + v'$$

for some  $c_1, \dots, c_m \in K$ ,  $u_1, \dots, u_m, v \in F(t)$ .

Here we use that the subfield of constants of  $F(t)$  is  $K$ .

Corollaries

The main corollary

Some special cases

On elliptic integrals

Let  $x$  be the solution of differential equation mentioned above. And  $x \in F(t_1, \dots, t_n)$ .

We will use induction on  $n$  (we don't fix the field  $F$ ).

For short we denote  $t = t_1$ .

Using the inductive assumption, we get

$$\alpha = \sum_{i=1}^m c_i \frac{u_i'}{u_i} + v'$$

for some  $c_1, \dots, c_m \in K$ ,  $u_1, \dots, u_m, v \in F(t)$ .

Here we use that the subfield of constants of  $F(t)$  is  $K$ .

Now we consider 3 cases

- ▶  $t$  is transcendental over  $F$  and it is a logarithm;
- ▶  $t$  is transcendental over  $F$  and it is an exponent;
- ▶  $t$  is algebraic over  $F$ .
